recovery_time	0	1	42.17	23.15	2.0	31.0	39.00	49.0	365.0	

The "recovery" dataset contains 15 columns and 3000 observations without any missing values after omitting the `id` variable. We have 14 predictors (6 numeric and 8 factor(character) variables) in the dataset. Then we partition the dataset into two parts: training data (80%) and test data (20%).

Model training Preparation

```
# data partition
set.seed(2358)
indexTrain <- createDataPartition(y = dat$recovery_time, p = 0.8, list = FALSE)
train <- dat[indexTrain, ]
test <- dat[-indexTrain, ]

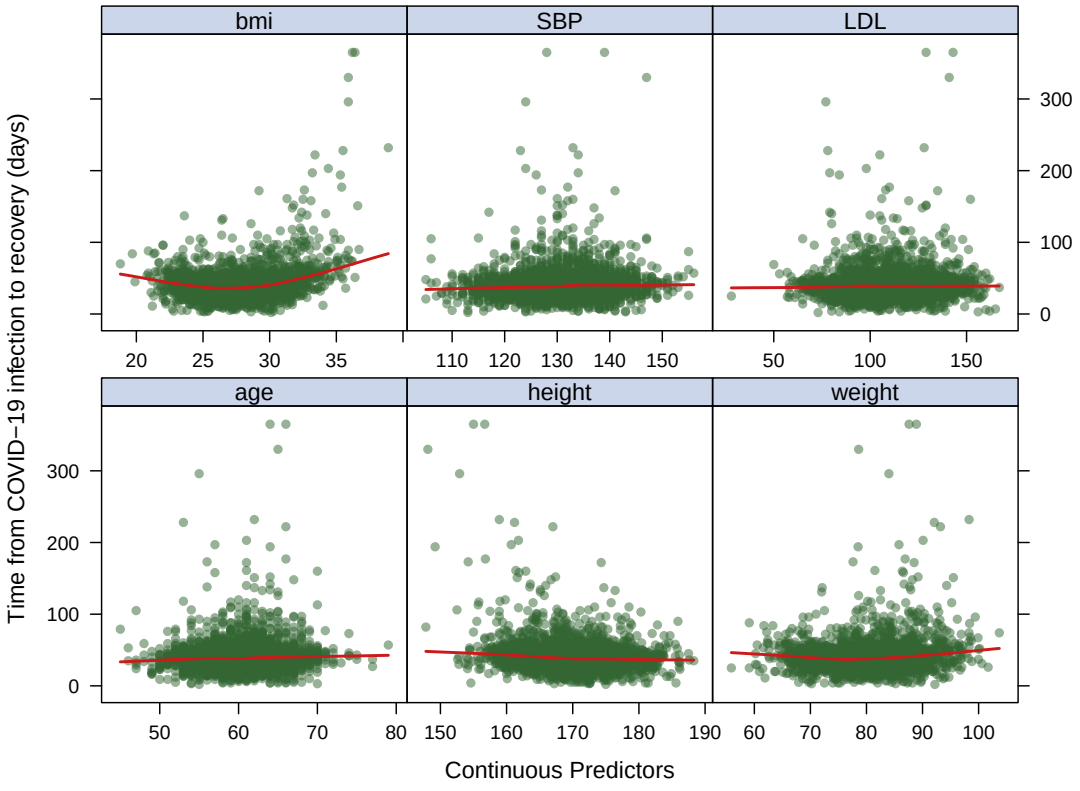
# matrix of predictors
x <- model.matrix(recovery_time~.,train)[,-1]
x2 <- model.matrix(recovery_time~.,test)[,-1]

# vector of response
y <- train$recovery_time
y2 <- test$recovery_time
```

Expoloratory Data Analysis

```
# Remove all the categorical predictors out from x before plotting
x_continuous <-
  x[, !(colnames(x) %in%
          c("gender1", "race2","race3", "race4",
            "smoking1","smoking2", "hypertension1",
            "diabetes1", "vaccine1", "severity1", "studyB"))]

# For Continuous Predictors
theme1 <- trellis.par.get()
theme1$plot.symbol$col <- rgb(.2, .4, .2, .5)
theme1$plot.symbol$pch <- 16
theme1$plot.line$col <- rgb(.8, .1, .1, 1)
theme1$plot.line$lwd <- 2
theme1$strip.background$col <- rgb(.0, .2, .6, .2)
trellis.par.set(theme1)
featurePlot(x_continuous,
            y,
            plot = "scatter",
            span = .5,
            labels = c("Continuous Predictors","Time from COVID-19 infection to recovery (days)"),
            type = c("p", "smooth"),
            layout = c(3, 2))
```



```
# For Categorical Predictors
dis_gender = train %>%
  ggplot(aes(x = gender, y = recovery_time)) +
  geom_violin(fill = "orange", color = "blue", alpha = .5) +
  scale_x_discrete(labels = c('Female','Male'))

```

```
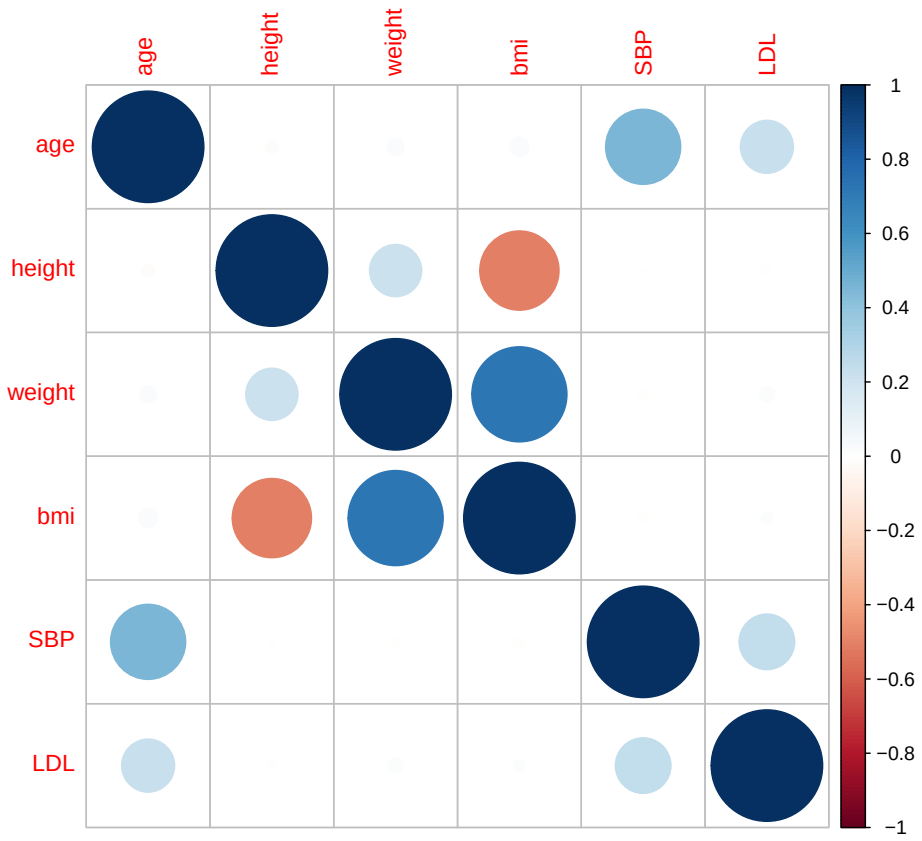
# Correlation plots
corrplot(cor(x_continuous), method = "circle", type = "full")
```



From the correlation matrix, some multicollinearities are severe shown in the continuous predictors of training data, cross-validation will be applied in the next steps.

Next, we will fit 6 linear models(Linear, Lasso, ridge, elastic net, PCR, PLS) and 2 non-linear models(GAM, MARS) using caret, and conduct the model comparison to choose the best fitted one.

Linear

```
# 10-fold cv on best
ctrl1 <- trainControl(method = "cv", number = 10)

# Fitting the model with Cross-validation
set.seed(2358)

```
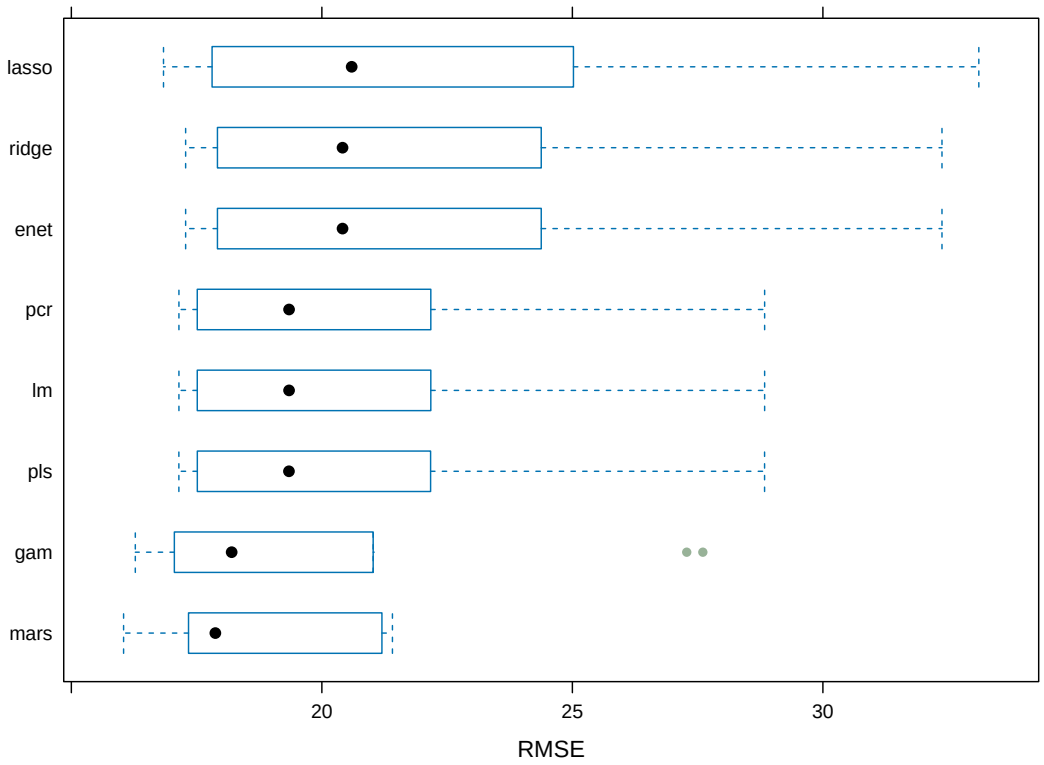
# RMSE box-plot between models
bwplot(resamp, metric = "RMSE")
```



Based on the summary and plot, we would likely use the Multivariate Adaptive Regression Splines (MARS) model to predict the recovery time from COVID-19 illness because it minimizes the mean RMSE over resamples.
